## Poverty in the United States: 2002

## Current Population Reports

Consumer Income

By
Bernadette D. Proctor
and
Joseph Dalaker

This report was prepared under the direction of Joseph Dalaker and Sharon Stern, Acting Chief, Poverty and Health Statistics Branch. Charles T. Nelson, Assistant Division Chief for Income, Poverty, and Health Statistics, Housing and Household Economic Statistics Division, provided overall direction.

David Nguyen and John Dinh, Demographic Surveys Division, processed the Current Population Survey 2002 and 2003 Annual Social and Economic Supplement files. Caroline Carbaugh, Chief of the Survey Processing Branch, Jaime Hasiuk, Thy Le, Stacy Lyons, Mary Thrift Bush, and Kirk Davis programmed the detailed tables and produced the publication tables.

Tim J. Marshall, under the supervision of Greg Weyland, Demographic Surveys Division, prepared specifications for the computer-assisted interviewing instrument used to conduct the Annual Social and Economic Supplement. Andrew M. Stevenson, Technologies Management Office, programmed the instrument.

Additional people within the Census Bureau also made significant contributions to the preparation of this report. Kathleen S. Short, Erika Steinmetz, Alemayehu Bishaw, Shailesh Bhandari, and Larry Long reviewed the contents.

Sampling review was conducted by Jana Shepherd and Alfred G. Meier of Demographic Statistical Methods Division.
U.S. Census Bureau field representatives and telephone interviewers collected the data. Without their dedication, the preparation of this report or any other report from the Current Population Survey would be impossible.

Greg Carroll, Barbara M. Abbott, Jan Sweeney, and Mary Stinson of the Administrative and Customer Services Division, Walter C. Odom, Chief, provided publications and printing management, graphics design and composition, and editorial review for print and electronic media. General direction and production management were provided by Susan L. Rappa, Chief, Publications Services Branch.

## Poverty in the United States: 2002

## INTRODUCTION

Poverty data offer an important way to evaluate the nation's economic well-being. This report illustrates how the official poverty rates vary by selected characteristics - age, race and Hispanic origin, nativity, family composition, work experience, and geography. These data show how many people were in poverty in 2002 and how the poverty population has changed. A description of how the Census Bureau measures poverty may be found on page 4. Because the poverty population in the United States is too diverse to be characterized along any one dimension, the report also includes several alternative ways of measuring poverty, and is accompanied by a separate report, Supplemental Measures of Material Well-Being: Expenditures, Consumption, and Poverty: 1998 and 2001 (P23-201).

## HIGHLIGHTS

- The official poverty rate in 2002 was 12.1 percent, up from 11.7 percent in 2001.
- In 2002, people below the official poverty thresholds numbered 34.6 million, a figure 1.7 million higher than the 32.9 million in poverty in 2001.
- At 16.7 percent, the poverty rate for children did not change between 2001 and 2002, but remained higher than that of 18-to-64-year-olds and seniors aged 65 and over. However, the number of children in poverty increased to 12.1 million in 2002, up from 11.7 million in 2001.
- For people 18 to 64 years old, both the number in poverty and the poverty rate rose from 2001 to 2002 - from 17.8 million to 18.9 million, and from 10.1 percent to 10.6 percent, respectively. Similarly, the number of elderly in poverty increased from 3.4 million in 2001 to 3.6 million in 2002, though their poverty rate remained unchanged at 10.4 percent. ${ }^{1}$
- Because racial and ethnic categories were redefined in 2002, no single comparison of poverty rates by race between 2001 and 2002 meets all needs. However, using a variety of definitions for the race categories for 2002,

[^0]
## Accuracy Statement

The estimates in this report are based on interviewing a sample of the population. Respondents provide answers to the best of their ability, but as with all surveys, the estimates may differ from the actual values. All statements in this report have undergone statistical testing, and all comparisons are significant at the 90-percent confidence level. Further information on the source and accuracy of the estimates is at www.census.gov/hhes/poverty/poverty02/pov02src.pdf.

- The poverty rates in 2002 for non-Hispanic Whites ( 8.0 percent for those who identified with no other race groups) and Asians ( 10.0 percent to 10.3 percent, depending on the race definition) were not different from the rates for the closest groups available in 2001. ${ }^{2}$
- Among people who reported Black in 2002, 23.9 percent to 24.1 percent were in poverty, depending on the race definition. Both figures were higher than the 22.7 percent for those who reported Black in 2001.
- For Hispanics (who may be of any race), the poverty rate was 21.8 percent in 2002, unchanged from 2001.3

[^1]- In 2002, 7.2 million families ( 9.6 percent) were in poverty, up from 6.8 million ( 9.2 percent) in 2001.
- For married-couple families, the number in poverty and the poverty rate rose from 2001 to 2002 - from 2.8 million to 3.1 million, and from 4.9 percent to 5.3 percent, respectively.
- The number of female householder families with no husband present in poverty increased to 3.6 million in 2002 from 3.5 million in 2001 . The poverty rate for these families was unchanged from 2001, at 26.5 percent.
- The poverty rate in the Midwest increased from 9.4 percent in 2001 to 10.3 percent in 2002. The poverty rates in the Northeast, South, and West did not change.
- The number in poverty and the poverty rate for people living in the suburbs rose from 12.1 million and 8.2 percent in 2001 to 13.3 million and 8.9 percent in 2002; neither the number in poverty nor the poverty rate changed in central cities or outside metropolitan areas. ${ }^{4}$
${ }^{4}$ In this report, "suburbs" refers to metropolitan areas outside central cities.

## POVERTY IN THE UNITED STATES

For the second consecutive year, the poverty rate and the number in poverty both rose from the prior year. In 2002, the poverty rate was 12.1 percent ( 34.6 million people), up from 11.7 percent ( 32.9 million people) in 2001 . Figure 1 displays poverty rates and the number in poverty over time, beginning with 1959, the first year for which poverty statistics are available. Tables 1 and 2 present the number in poverty and poverty rates in 2001 and 2002 for many demographic groups, and show which groups had statistically significant changes.

Table 1.
Number in Poverty and Poverty Rate by Race and Hispanic Origin: 2001 and 2002
(Numbers in thousands, confidence intervals (C.I.) in thousands or percentage points as appropriate)

[^2]
## New Racial Groups

The estimates in this report are based on the Current Population Survey (CPS) 2001, 2002, and 2003 Annual Social and Economic Supplement (ASEC) and provide information for calendar years 2000, 2001, and 2002, respectively.

For the first time in 2003, CPS respondents were asked to identify themselves in one or more racial groups; ${ }^{5}$ previously they had to choose one. This change complicates year-to-year comparisons. We do not know how people who reported more than one race in 2002 previously reported their race. Therefore, there is no single way to compare changes to poverty by race.
${ }^{5}$ OMB establishes the official guidelines for the collection and classification of data for race (including the option for respondents to mark more than race) and Hispanic origin. Race and Hispanic origin are treated as separate and distinct concepts in accordance with OMB's guidelines. For further information, see www.whitehouse.gov lomb/ombdirl 5.html.

Table 1 compares last year's single-race figures with two different figures this year: one comparison is based on those who reported one race alone and the other is based on those who reported either that race only or that race and at least one other race. For example, this year's poverty report will compare the 2001 poverty figures for Blacks with 2002 poverty figures for those who reported themselves as:

1. Black alone, did not report any other race, and
2. Black alone or in combination with some other race(s).

The Census Bureau will provide year-to-year comparisons for each racial group, with the exception of American Indians and Alaska Natives, and Native Hawaiians and Other Pacific Islanders, who will not be examined separately (because the sample was not sufficiently large).

Figure 1.
Number in Poverty and Poverty Rate: 1959 to 2002

Note: The data points represent the midpoints of the respective years.

## The Official Measure of Poverty

Following the Office of Management and Budget's (OMB) Statistical Policy Directive 14, the Census Bureau uses a set of money income thresholds that vary by family size and composition to determine who is in poverty (see the matrix below).
Poverty Thresholds in 2002 by Size of Family and Number of Related Children
Under 18 Years
(Dollars)

| Size of family unit | Related children under 18 years |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | None | One | Two | Three | Four | Five | Six | Seven | Eight or more |
| One person (unrelated individual): Under 65 years 65 years and over | $\begin{aligned} & 9,359 \\ & 8,628 \end{aligned}$ |  |  |  |  |  |  |  |  |
| Two people: Householder under 65 years... Householder 65 years and over | $\begin{aligned} & 12,047 \\ & 10,874 \end{aligned}$ | $\begin{aligned} & 12,400 \\ & 12,353 \end{aligned}$ |  |  |  |  |  |  |  |
| Three people | 14,072 | 14,480 | 14,494 |  |  |  |  |  |  |
| Four people | 18,556 | 18,859 | 18,244 | 18,307 |  |  |  |  |  |
| Five people | 22,377 | 22,703 | 22,007 | 21,469 | 21,141 |  |  |  |  |
| Six people | 25,738 | 25,840 | 25,307 | 24,797 | 24,038 | 23,588 |  |  |  |
| Seven people | 29,615 | 29,799 | 29,162 | 28,718 | 27,890 | 26,924 | 25,865 |  |  |
| Eight people | 33,121 | 33,414 | 32,812 | 32,285 | 31,538 | 30,589 | 29,601 | 29,350 |  |
| Nine people or more | 39,843 | 40,036 | 39,504 | 39,057 | 38,323 | 37,313 | 36,399 | 36,173 | 34,780 |

Source: U.S. Census Bureau.

If a family's total income is less than that family's threshold, then that family, and every individual in it, is considered in poverty. The official poverty thresholds do not vary geographically, but they are updated annually for inflation using the Consumer Price Index (CPI-U). The official poverty definition uses money income before taxes and does not include capital gains and noncash benefits (such as public housing, medicaid, and food stamps).

Example: Suppose Family A consists of five people: two children, their mother, father, and greataunt. Family A's poverty threshold in 2002 was $\$ 22,007$. Suppose also that each member had the following income in 2002:

| Mother | $\$ 10,000$ |
| :--- | ---: |
| Father | 5,000 |
| Creat-aunt | 10,000 |
| First child | 0 |
| Second child | 0 |
| Total: | $\$ 25,000$ |

Since their total family income, $\$ 25,000$ was greater than their threshold ( $\$ 22,007$ ), the family would not be considered "in poverty" according to the official poverty measure.

While the thresholds in some sense represent families' needs, the official poverty measure should be interpreted as a statistical yardstick rather than as a complete description of what people and families need to live. Moreover, many of the government's aid programs use different dollar amounts as eligibility criteria.
Poverty rates and the number in poverty are one important way of examining people's well-being. Other more detailed measures of poverty are considered in the sections "Depth of Poverty Measures" and "Alternative Poverty Measures," and in the recent Census Bureau report, Supplemental Measures of Material Well-Being: Expenditures, Consumption and Poverty (P23-201).

For a history of the official poverty measure see "The Development of the Orshansky Thresholds and Their Subsequent History as the Official U.S. Poverty Measure," by Gordon Fisher, at www.census.gov /hhes/poverty/povmeas/papers /orshansky.html.

## Weighted average thresholds:

Some data users want a summary of the 48 thresholds to get a general sense of the "poverty line." These average thresholds provide that summary, but they are not used to compute poverty data.

| One person | $\$ 9,183$ |
| :--- | ---: |
| Two people | 11,756 |
| Three people | 14,348 |
| Four people | 18,392 |
| Five people | 21,744 |
| Six people | 24,576 |
| Seven people | 28,001 |
| Eight people | 30,907 |
| Nine people or more | 37,062 |

Figure 2.
Poverty Rates by Age: 1959 to 2002

Note: The data points represent the midpoints of the respective years. Data for people 18 to 64 and 65 and older are not available from 1960 to 1965.
Source: U.S. Census Bureau, Current Population Survey, 1960-2003 Annual Social and Economic Supplements.

## Race and Hispanic Origin

Until this year, the CPS questionnaire asked respondents to choose only a single race. As a result of a new standard issued by the Office of Management and Budget, this year's questionnaire asked respondents to report one or more racial groups. ${ }^{6}$ Consequently, this report will discuss ten racial and ethnic groups. Although the new groups do not align exactly with the ones used in previous years, Table 1 shows poverty rates for 2001 using the five racial and ethnic groups we could report that year, the rate for 2002 using the new groups, and the percentage-point changes between similar groups.

In 2002, among people who reported only one race, the poverty

[^3]rate was 8.0 percent for people who indicated they were nonHispanic White, unchanged from the closest category available in 2001. Although the poverty rate for non-Hispanic Whites was lower than for the other racial and ethnic groups, non-Hispanic Whites accounted for 45.0 percent of the people in poverty and 68.0 percent of the total population.

Among people who indicated that they were Black (and no other race) in 2002, 24.1 percent were in poverty, higher than the 22.7 percent for those who reported Black in 2001. The number in poverty also rose (from 8.1 million to 8.6 million). For the Black population that includes those who identified with more than one race (in addition to single-race Blacks), the corresponding figures in 2002 were 23.9 percent and 8.9 million, also significant increases from 2001.

The race category "Asian or Pacific Islander" was divided into two groups in 2002: "Asians" and "Native Hawaiians and Other Pacific Islanders." That distinction makes poverty rate comparisons with Asians and Pacific Islanders in 2001 especially difficult. Table 1 thus compares poverty rates for four groups in 2002 with the Asian and Pacific Islander poverty rate in 2001. The poverty rate for single-race Asians in 2002 was 10.1 percent not statistically different from the rate for Asians and Pacific Islanders in 2001. None of the other poverty rates for groups including the Asian population differed statistically from the rate for Asians and Pacific Islanders in 2001.

Among people who reported Hispanic (of any race), the number in poverty increased, from 8.0 million in 2001 to 8.6 million in 2002, while the poverty rate remained unchanged at 21.8 percent in 2002.

Table 2.

## Work Experience During the Year for People Aged 16 and Older: 2002

(Numbers in thousands, confidence intervals (C.I.) in thousands or percentage points as appropriate)

| Characteristic | Total | Number in poverty | 90- <br> percent C.I. ( $\pm$ ) | Percent poverty | percent C.I. ( $\pm$ ) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| All workers | 151,546 | 8,954 | 351 | 5.9 | 0.2 |
| Worked full-time year-round | 100,659 | 2,635 | 193 | 2.6 | 0.2 |
| Not full-time year-round | 50,887 | 6,318 | 297 | 12.4 | 0.6 |
| Did not work at least one week | 69,595 | 14,647 | 443 | 21.0 | 0.6 |

Notes: Full-time, year-round workers are those who worked 50 or more weeks and 35 or more hours per week during the calendar year. Paid vacations are counted as time worked. For an explanation of confidence intervals, see "Standard errors and their use" at www.census.gov/hhes/poverty/poverty02 /pov02src.pdf. Details may not sum to totals because of rounding.

Source: U.S. Census Bureau, Current Population Survey, 2003 Annual Social and Economic Supplement.

## Age

People 18 to 64 years old accounted for most of the net change between 2001 and 2002; both their number in poverty and poverty rate increased ( 18.9 million and 10.6 percent in 2002, up from 17.8 million and 10.1 percent in 2001). People 65 and over showed an increase only in the number in poverty in 2002 3.6 million, up from 3.4 million in 2001 - while their poverty rate remained unchanged at 10.4 percent in 2002 . $^{7}$

In 2002, the number of children in poverty under 18 was 12.1 million, up from 11.7 million in 2001. This increase did not translate into a higher poverty rate: 16.7 percent in 2002, unchanged from 2001. The poverty rate for children was higher than the rates for the other two age groups shown in Table 2. In addition, children represented a disproportionate share of the people in poverty ( 35.1 percent), as they were only one-fourth ( 25.5 percent) of the total population.

Children under 6 have been particularly vulnerable to poverty. In

[^5]2002, the poverty rate for related children under 6 was 18.5 percent, unchanged from 2001. Of children under 6 living in families with a female householder, no spouse present, 48.6 percent were in poverty, five times the rate of their counterparts in married-couple families ( 9.7 percent).

## Nativity

The foreign born experienced an increase in their number in poverty - 5.6 million in 2002, compared with 5.2 million in 2001 - but not in their poverty rate - 16.6 percent in 2002. In contrast, the native population had increases in both their poverty rate (from 11.1 percent to 11.5 percent) and number in poverty (from 27.7 million to 29.0 million) between 2001 and $2002 .{ }^{8}$

Of the foreign-born population, approximately 3 in 8 ( 38.4 percent) were naturalized citizens,

[^6]and the rest were noncitizens. Poverty rates for these two groups bracketed the 11.5 percent rate for the native population - 10.0 percent ( 1.3 million) for foreign-born naturalized citizens and 20.7 percent ( 4.3 million) for those who had not become citizens. Neither foreign-born group experienced an increase in their poverty rate or the number of people in poverty.

## Families and Unrelated Individuals

The poverty rate and number of families in poverty increased to 9.6 percent, or 7.2 million, in 2002, up from 9.2 percent or 6.8 million in 2001 . Both marriedcouple families and families with a female householder and no husband present experienced an increase in the number in poverty between 2001 and 2002, but married-couple families also had an increase in the poverty rate whereas female householder families did not.

Specifically, the poverty rate and number in poverty married-couple families increased from 4.9 percent and 2.8 million in 2001 to 5.3 percent and 3.1 million in 2002.

The number of families in poverty with a female householder and no husband present increased from 3.5 million in 2001 to 3.6 million in 2002, but their poverty rate for 2002 (26.5 percent) did not change. Families with a female householder and no husband present made up half of all families in poverty. In 2002, families with a male householder, no spouse present showed no increase in their number in poverty or their poverty rate (564,000 and 12.1 percent in 2002).

For unrelated individuals (people not living with any relatives), the number in poverty increased to
9.6 million in 2002, up from
9.2 million in 2001, whereas their poverty rate was unchanged from 2001 (20.4 percent). Among unrelated individuals, both men ( 4.0 million in 2002, up from 3.8 million in 2001) and women ( 5.6 million in 2002, up from 5.4 million in 2001) showed increases in their number in poverty in 2002. The poverty rates for men (17.7 percent) and women (22.9 percent) were unchanged in 2001. Women accounted for 58.2 percent of unrelated individuals in poverty in 2002.

## Work Experience

Those who worked in 2002 had a lower poverty rate than those who did not - 5.9 percent compared with 21.0 percent (see Table 3). ${ }^{9}$ Among full-time year-round workers, the poverty rate was much lower than for those who worked part-time or part-year (2.6 percent compared with 12.4 percent).

Looking at the data another way, we see that 37.9 percent, or 9.0 million of those in poverty worked, but the jobs they held were usually not full-time yearround. Among the working-age poverty population, 11.2 percent held full-time year-round jobs in 2002 (2.6 million), compared with 26.8 percent ( 6.3 million) who worked part-time or part-year, and 62.1 percent ( 14.6 million) did not work at all.

Because poverty is a family-based measure, the income of one family member affects the poverty status of the other members, such as children and other dependents. Therefore, Figure 3 and Figure 4 display data for people in families (of all ages), by the number of workers in the family.

[^7]Figure 3.

## Percent of People in Families by Number of Workers: 2001 and 2002

Note: Details may not sum to totals because of rounding.
Source: U.S. Census Bureau, Current Population Survey, 2002 and 2003 Annual Social and Economic Supplements.

Figure 4.
Poverty Rates of People in Families by Family Type and Presence of Workers: 2002

Source: U.S. Census Bureau, Current Population Survey, 2003 Annual Social and Economic Supplement.

Turning first to Figure 3, the percentage of people without any workers in their family rose to 10.3 percent in 2002 , from 10.0 percent in 2001 . The remaining 89.7 percent lived with at least one worker in 2002.

Figure 4 shows lower poverty rates for family members living with at least one worker than for family members with no workers 7.9 percent compared with 32.0 percent. Among all family types, poverty rates were higher for those not living with workers than for those who lived with at least one worker.

## Region

The Midwest was the only region to show an increase in both the number in poverty and poverty rate in 2002 , up to 6.6 million or 10.3 percent from 6.0 million or 9.4 percent in 2001. The poverty rates for the Northeast and West remained unchanged in 2002 at 10.9 percent and 12.4 percent. ${ }^{10}$ In 2002, 14.0 million people in poverty lived in the South, up from 13.5 million in 2001. The South still had the highest poverty rate at 13.8 percent in 2002, unchanged from 2001. The South had a disproportionately large share of those in poverty: 40.6 percent, compared with 35.6 percent of all people.

## Residence

The poverty rate and number in poverty increased in the suburbs, from 8.2 percent or 12.1 million in 2001 to 8.9 percent or 13.3 million in 2002. For people living inside central cities, the poverty rate was 16.7 percent in 2002 , unchanged from 2001. Nonetheless, a disproportionate share of people in poverty lived inside central cities:

[^8]39.9 percent compared with 29.0 percent of all people. Taking suburbs and central cities together, the poverty rate for people in metropolitan areas was 11.6 percent in 2002, up from 11.1 percent in 2001. Among those living outside metropolitan areas, the number in poverty and their poverty rate were 7.5 million and 14.2 percent in 2002, unchanged from 2001.

## State Poverty Data

Table 4 contains poverty rates for the 50 states, the District of Columbia, and the United States using 3-year averages covering 2000 to 2002 to improve the statistical reliability of the estimates. (See the text box "Interpreting State Poverty Data" on page 11.) Readers should be aware that although Arkansas appeared to have the highest poverty rate in Table 4 (18.0 percent), it was not statistically different from the rates for four states - Louisiana, Mississippi, New Mexico, and West Virginia - and the District of Columbia, although it was higher than the rates for the other states. Similarly, the 3-year average poverty rate for New Hampshire, even though it appeared to be lowest (5.6 percent), was not statistically different from that of Minnesota.

To compare changes in poverty rates at the state level, the Census Bureau recommends using 2-year moving averages (2000-2001 and 2001-2002). Based on this approach, Figure 5 shows that nine states - Arkansas, Florida, Hawaii, Illinois, Maine, Michigan, Mississippi, South Carolina, and Utah - showed increases while the other states remained unchanged.

## DEPTH OF POVERTY MEASURES

While categorizing people as "in poverty" or "not in poverty" is one
summary of their economic position, in reality economic situations fall into a much broader spectrum. Two "depth of poverty" measures more fully reflect the distribution of people's economic well-being. The ratio of income to poverty compares a family's income with its poverty threshold, and expresses that comparison as a ratio. The income deficit (surplus) tells how many dollars a family's or unrelated individual's income is below (above) its poverty threshold. These measures illustrate how the composition of the low-income population varies by the severity of poverty.

## Ratio of Income to Poverty Level

Table 5 presents the number and percentage of people below multiples of their poverty threshold those below 50 percent of poverty ("Under 0.50"), those in poverty ("Under 1.00"), and those below 125 percent of poverty ("Under 1.25").

In 2002, the number of those in "severe poverty" - defined as those with family (unrelated individual) incomes below one-half of their poverty threshold - rose to 14.1 million, from 13.4 million in 2001. Those in severe poverty represented 4.9 percent of the total population and 40.7 percent of the poverty population, rates unchanged from 2001 to 2002 (see Table 5).

The number and percent of "near poor" (people with incomes at or above their threshold but below 125 percent of their threshold) remained unchanged in 2002, at 12.5 million and 4.4 percent, respectively.

The demographic makeup of the population varies at varying degrees of poverty. For instance, in 2002 the older population was

Table 4.
Percent of People in Poverty by State: 2000, 2001, and 2002

[^9]
## Interpreting State Poverty Data

Poverty estimates for states are not as reliable as national estimates. These state poverty rate estimates are intended to provide a sense of the ranges within which the poverty rates probably exist. We recommend using caution when comparing poverty rate estimates across states, or poverty rates for the same state across years, because their variability is high.

Why show averages? Why not show the latest year alone?

Averaging poverty rates over several years improves the estimates' reliability. An estimate's reliability is measured by a 90-percent confidence interval: the smaller the confidence interval, the more reliable the estimate. For instance, using 2002 data alone, Alabama had a
confidence interval of $\pm 1.89$ percentage points around its poverty rate, but using a 3-year average, the confidence interval decreased to $\pm 1.40$ percentage points. For more information on confidence intervals, see the CPS Source and Accuracy Statement at www.census.gov/hhes/poverty /poverty02/pov02src.pdf.

Source: U.S. Census Bureau, Current Population Survey, 2001, 2002, and 2003 Annual Social and Economic Supplements.

## Example: "Depth of Poverty" Measures

Suppose Family A has five people - two children and three adults - and has an income of $\$ 25,000$.

to poverty $\quad$ Family A's poverty threshold $\quad \$ 22,007$
Since Family A's income-to-poverty ratio was at least as great as one, Family A is not in poverty. However, since its ratio was also less than 1.25 , it would be considered "near poor," and its five members would be tallied in Table 5 as "Under 1.25." All people in the same family have the same ratio.

Since Family A's income was greater than its threshold, its income surplus - the number of dollars above its poverty threshold - was $\$ 2,993(\$ 25,000-\$ 22,007)$. Family A would be tallied in the bottom half of Table 6, in the column, " $\$ 2,000$ to $\$ 2,999$."

Table 5.
People With Income Below Specified Ratios of Their Poverty Thresholds by Selected Characteristics: 2002
(Numbers in thousands)

| Characteristic | Total | Under 0.50 |  | Under 1.00 |  | Under 1.25 |  |

more highly concentrated just above their poverty thresholds than below the thresholds. Among people aged 65 and over, 2.2 percent were below 50 percent of their poverty threshold, compared with 4.9 percent for all people, and 10.4 percent were in poverty, compared with 12.1 percent for all
people. However, people 65 and over and the total population had similar percentages below 125 percent of poverty ( 16.9 percent for seniors, statistically indistinguishable from 16.5 percent for all people). Since the older population was more sparsely populated among those in poverty, in
comparison with the entire population, the older population therefore was more highly concentrated among the "near poor."

## Income Deficit

The income deficit for families in poverty (the difference in dollars between a family's income and its

Source: U.S. Census Bureau, Current Population Survey, 2003 Annual Social and Economic Supplement.
poverty threshold) averaged \$7,205 in 2002 (see Table 6), down from \$7,345 in 2001.1

The average income deficit was greater for families in poverty with a female householder with no husband present $(\$ 7,648)$ than for married-couple families in poverty $(\$ 6,727)$ and male householder families with no wife present $(\$ 6,954) .{ }^{12}$ The income deficit per capita for female-householder families $(\$ 2,371)$ was higher than for married-couple families $(\$ 1,836)$

[^10]but indistinguishable from malehouseholder families (\$2,311). ${ }^{13}$ The income deficit per capita is computed by dividing the average deficit by the average number of people in that type of family. Because families with a female householder and no husband present were smaller than married-couple families, the greater per capita deficit for female-householder families reflects their smaller family size as well as their lower income.

For unrelated individuals in poverty (people who do not live with

[^11]relatives), the average income deficit was $\$ 4,798$ in 2002; the $\$ 4,593$ deficit for women was lower than that for men at $\$ 5,082$. Because there were more female than male unrelated individuals aged 65 and over, and because unrelated individuals aged 65 and over have lower poverty thresholds, the lower average deficit for women reflects differences in age, not just income.

In 2002, 432,000 families in poverty had incomes less than $\$ 500$ below their poverty thresholds, while 288,000 had incomes within $\$ 500$ above their respective poverty thresholds. Therefore, slight modifications to raise the poverty
thresholds would increase the poverty rate less than a slight lowering of the thresholds would reduce it.

## TRANSITIONS INTO AND OUT OF POVERTY

The CPS ASEC provides good estimates of the net change in the number of people in poverty from one year to the next, but it does not show how long a given person remains in poverty, what percent of the poverty population remained in poverty in the following year, how many people escaped poverty, how many people fell below their poverty threshold, or any changes in a person's poverty status within a given year.

These more dynamic measures of poverty are available from the Survey of Income and Program Participation (SIPP). Unlike the CPS ASEC, which is not designed to follow the same respondents in consecutive years, the SIPP is a longitudinal survey that interviews the same respondents multiple times a year over the course of 3 to 4 years.

The latest longitudinal data available from the SIPP come from the 1996 panel, which covered January 1996 to December 1999. ${ }^{14}$ Figure 6 displays the distribution of poverty spells by their duration. A poverty spell is the number of consecutive months a person stays in poverty. To be considered in a spell, the person must be in poverty for at least 2 months. To avoid bias, Figure 6 does not show poverty spells that were already underway before the first interview month.

[^12]According to the 1996 SIPP panel, a little over half of the spells lasted 4 months or less (51.1 percent), and about four-fifths ( 79.6 percent) of spells were over within 1 year. However, a person can have more than one poverty spell in the same year - they may be in poverty for a few months, come out of poverty, and fall below the poverty level again some time later. Thus, measuring poverty on an annual basis instead of a monthly basis provides a different picture of the poverty population. Among those who were in poverty in 1996 (based on income for the entire year), 65.1 percent remained in poverty in 1997, 55.5 percent were in poverty in 1998 (but may not have been in 1997), and 50.5 percent were in poverty in 1999 (but may not have been in the previous 2 years). By contrast, among those who were not in poverty in 1996, only 2.9 percent were in poverty in 1997, 3.3 percent were in poverty in 1998 , and 3.5 percent were in poverty in 1999. ${ }^{15}$

In short, the people in poverty are not a static population; rather, people stay in poverty for different lengths of time. About 34.2 percent of all people were in poverty for at least 2 consecutive months from 1996 through 1999, but only 2.0 percent were in poverty every month of that 4-year period. ${ }^{16}$

## ALTERNATIVE POVERTY MEASURES

This section provides two sets of alternative estimates of poverty. The first section focuses on recom-
${ }^{15}$ The percentage of people who entered poverty in 1998 was not statistically different from the percentage who entered in 1999.
${ }^{16}$ For further information, see John Iceland, Dynamics of Economic Well-Being: Poverty 1996-1999, (P70-91) available at www.census.gov/hhes/www/sipp96 /sipp96.html.
mendations from the National Academy of Sciences on how to measure resources (income) and how to change the poverty thresholds (the measure of need). The second presents the effects of changing the income measure in ways consistent with the alternative income measures presented in "Income in the United States: 2002" as well as on how changes in the inflation adjustment factor used for the thresholds over the past several decades would affect poverty. ${ }^{17}$ Readers will find both of interest in assessing alternative estimates of poverty. We note that some researchers think it is important to consider changes on the resource side and the threshold side together, whereas others focus on how to measure resources while using the historical poverty thresholds. Additional research on measuring economic well-being is underway. ${ }^{18}$ The Census Bureau does not choose which changes in poverty measurement methodology are most appropriate; that responsibility rests with the Office of Management and Budget.

## Poverty Estimates Based on National Academy of Sciences Recommendations

In 1995, a panel of the National Academy of Sciences (NAS) issued a report that recommended new ways to measure income, families' needs, and other aspects related to measuring poverty. ${ }^{19}$ Because the

[^13]
## Figure 6.

## Duration of Poverty Spells: 1996 to 1999

(Percent of poverty spells. Excludes spells underway during the first interview month)

Note: 2.0 percent of people were in poverty for all 48 months; they are not included in the above distribution.
Source: U.S. Census Bureau, 1996 Survey of Income and Program Participation; from John Iceland, Dynamics of Economic Well-Being: Poverty 1996-1999, P70-91, July 2003. See also www.census.gov/hhes/www/sipp96/sipp96.html.
official poverty measure does not take account of how taxes, noncash benefits, and work-related and medical expenses affect people's well-being, the NAS panel observed that the official measure does not show how policy changes in those areas affect who is considered in poverty. In addition, the panel noted that the official poverty measure does not take into account how the cost of basic goods (such as food and housing) has changed relative to other goods since the early 1960s, when the official poverty measure was developed. Moreover, it does not reflect that those costs vary by geography. Nor do the official thresholds, according to the NAS panel, accurately account for increased expenses and economies of scale that occur as family size increases. Hence, the NAS panel suggested a way to construct a
new poverty measure that addresses these issues.

In response to the professional debate that has followed the publication of the NAS report, the Census Bureau has been conducting research to refine some of the panel's measurement methods and to examine how the NAS panel's recommendations would affect the number in poverty and the poverty rate. ${ }^{20}$ Six alternative NAS-based measures are discussed below. These measures each account for work-related expenses, noncash benefits (such as food stamps and housing subsidies), and adjust thresholds by family size in similar

[^14]ways, but the measures differ among one another by how they account for health care costs and whether they consider geographic differences in the cost of living. ${ }^{21}$ The first three measures (labeled NGA for "no geographic adjustment") do not adjust the thresholds to account for geographic differences in housing costs. The last three (labeled GA) do, but are otherwise identical to their counterparts that do not account for geographic cost differences. (See Short, 2001, for a full discussion of the measures.)

The first measure most closely reflects the NAS panel's approach for taking into account how medical out-of-pocket expenses (MOOP) affect poverty. This measure is called "MOOP subtracted from income" (MSI). These medical expenses include health insurance premiums, copayments made to medical providers that are not covered by insurance, and other expenses paid out of the patient's pocket, such as over-the-counter medications. The MSI measure subtracts these expenses from family income before comparing the income with the family's threshold, which in this case excludes medical care from the family's "needs" (the threshold).

The second measure, "MOOP in the threshold" (MIT), increases the poverty threshold to take MOOP expenses into account, instead of subtracting these expenses from income. Using data from the 1997-1999 Consumer Expenditure
${ }^{21}$ The NAS panel did not advocate one particular dollar amount upon which to base threshold revisions; rather, they offered a range of thresholds. The analysis here uses the midpoint of the NAS panel's range.

## Official and Alternative (NAS-Based) Poverty Estimates: How Do They Differ?

| Question | Official measure |
| :--- | :--- |
| What counts as income? | Gross money income (that is, before taxes) of <br> all family members living in the same housing <br> unit, not counting capital gains. |
|  |  |
|  |  |
|  |  |
|  |  |
| What is used as a benchmark |  |
| for need? | First computed in 1963-64, the thresholds <br> were originally based on U.S. Department of <br> Agriculture (USDA) food budgets designed <br> for families under economic stress. Social <br> Security Administration analysts used 1955 |
|  | USDA data to find out what portion of their <br> income families spent on food, then multiplied |
| the food budgets by the inverse of that factor |  |
| to get the thresholds (with some adjustments |  |
| for two-person families and single people). |  |
| Except when federal interagency committees |  |
| made minor revisions, these thresholds have |  |$|$

What adjustments are made for geographic differences in the cost of living?

Alternative NAS-based estimates
Like the official measure, the alternative estimates add together the incomes of all family members who live together, except that the alternative estimates:

- Use after-tax income
- Include noncash benefits as income (such as food stamps and housing subsidies)
- Deduct some work-related expenses (such as transportation and child care) from income
- Take into account medical out-ofpocket expenses (each measure has a different method for doing so)

Unlike the official thresholds, which have no fixed relationship between thresholds for different-sized families (because they were derived with food budgets and spending data), the alternative estimates start with expenditures for food, clothing, shelter, and utilities (and for some measures, medical expenses) for a family of four-two adults and two children-plus a small additional amount for other expenses. These dollar amounts are adjusted for larger and smaller families, based on some aspects of their relative needs. The adjustments are made using three parameters: the first reflects that children tend to consume less than adults, the second reflects that a doubling of family size does not mean that every expense becomes twice as high, and the third reflects that the first child in a single-adult family represents a greater increase in expenses than the first child in a two-adult family.

Some estimates (labeled NGA) make no adjustment; others are adjusted using cost indices by state and metropolitan/nonmetropolitan residence, based on housing costs.

For further details about poverty measurement, see: "The Development of the Orshansky Poverty Thresholds and Their Subsequent History as the Official U.S. Poverty Measure" by Gordon Fisher, available at www.census.gov/hhes/poverty/povmeas/papers/orshansky.html; Experimental Poverty Measures: 1999 by Kathleen Short, available at www.census.gov/prod/2001pubs/p60-216.pdf.

Survey and the 1996 Medical Expenditures Panel Survey, the Census Bureau computed a threshold to allow for food, clothing, shelter, utilities, and MOOP. How much money was allowed for MOOP depended on the family's size, the presence of elderly family members, the self-reported health status of the family members, and differences in health insurance
coverage across families. Thus, for the MIT measures, the thresholds' allowances for MOOP reflect expected - that is, average medical expenses along those dimensions, not the family's actual expenses.

The third measure, CMB (for "combined" methods), combines attributes of both the MSI and MIT measures. Like the MIT measure,
the CMB includes expected MOOP expenditures in the thresholds. However, like the MSI measure, the CMB takes into account variations in medical needs across families. The CMB measure calculates the difference between the expected MOOP and the actual amounts each family spent out-of-pocket for medical care and subtracts the difference from family income.

Table 7.

## Alternative Poverty Estimates Based on National Academy of Sciences Recommendations: 2001 and 2002

(Numbers in thousands, poverty rates in percentages)

-Represents zero.
*Statistically different from zero at the 90-percent confidence level.
${ }^{1}$ Details may not sum to totals because of rounding.
Notes: While the alternative measures differ among one another in their computation of medical expenses and geographic variations in costs, they are similar in their scaling of thresholds by family size and their treatment of noncash benefits and child care and work-related expenses. See text and footnotes for additional information and references.

For an explanation of the measures, see text and Short (2001)
All measures are updated for inflation with the Consumer Price Index (CPI-U).
See www.census.gov/poverty/povmeas/report.htm for measures updated using growth in median expenditures.
MSI means medical out-of-pocket expenses (MOOP) subtracted from income.
MIT means MOOP included in the thresholds.
CMB means combined methods.
NGA means no geographic adjustment for housing costs.
GA means geographic adjustment for housing costs.
Source: U.S. Census Bureau, Current Population Survey, 2002 and 2003 Annual Social and Economic Supplements.

This way, families who had greater than expected medical expenses may be classified as in poverty when they otherwise would not be, but those who were unexpectedly healthy - and who thus spent less on MOOP than expected, leaving those funds available for other purposes - are classified as better off than they would be under both the official and MIT measures.

The MSI-NGA, MIT-NGA, and CMBNGA (no geographic adjustment) measures are complemented by three measures that include adjustments to the thresholds to account for geographic differences in cost of living; hence, they are labeled GA for "geographic
adjustment." They are otherwise identical to their counterparts that do not account for geographic cost differences.

All six measures use the CPI-U to update the thresholds from 1999 for inflation. Six additional NASbased measures are presented on the poverty measurement Web site; they use growth in median expenditures since 1999 for food, clothing, shelter and utilities, calculated from the Consumer Expenditure Survey, to update the measures as recommended by the NAS panel (see www.census.gov/hhes/poverty /povmeas/reports.htm).

All of the NAS-based alternative measures yielded a higher poverty
rate in 2002 than the official measure, as shown in Table 7. The MSIGA measure had the smallest difference from the official measure (12.3 percent compared with 12.1 percent for the official measure), followed by MSI-NGA (12.4 percent). However, the alternative poverty measures were more stable from year to year than the official measure. While the official poverty rate and number in poverty both increased significantly between 2001 and 2002, none of the alternative poverty rates changed and only the MIT-NGA measure showed any increase in the number in poverty between 2001 and 2002.

## What Alternative Measures of Income Are Used for Alternative Poverty Estimates?

Money Income (MI) is collected for all people in the sample 15 years old and over. Money income includes earnings, unemployment compensation, workers' compensation, Social Security, Supplemental Security Income, public assistance, veterans' payments, survivor benefits, pension or retirement income, interest, dividends, rents, royalties, income from estates, trusts, educational assistance, alimony, child support, assistance from outside the household, and other miscellaneous sources. It is income before deductions for taxes or other expenses and does not
include lump-sum payments or capital gains.

MI - Tx is money income plus realized capital gains (losses), less federal and state income taxes, and less payroll taxes.

MI - Tx + NC - MM is money income, plus realized capital gains (losses), less federal and state income taxes, less payroll taxes, plus the value of employer-provided health benefits and the value of all noncash transfers except medicare and medicaid. Noncash transfers include food stamps, rent subsidies, and free and reduced-price school lunches.

MI - Tx + NC is money income plus realized capital gains (losses), less federal and state income taxes, less payroll taxes, plus the value of employer-provided health benefits and all noncash transfers.

MI - Tx + NC + HE is money income plus realized capital gains (losses), less federal and state income taxes, less payroll taxes, plus the value of employ-er-provided health benefits and all noncash transfers, plus the annual benefits of converting one's home equity into an annuity, net of property taxes.

## Poverty Estimates Using Alternative Income Definitions

The following data illustrate how poverty rates change when different types of noncash benefits are treated as income and when taxes are taken into account, while holding constant the measure of need (the thresholds). These data series were first developed in the early 1980s, in response to a congressional request.

Recall that the official poverty measure uses money income before taxes, excluding capital gains, to measure resources. Before the Census Bureau developed the alternative income definitions, Congress did not have sufficient data to evaluate whether noncash government benefits were properly targeted. ${ }^{22}$

[^15]In response, the Census Bureau produced a series of reports about the valuation of noncash benefits and taxes and their effects on income and poverty. ${ }^{23}$ Since then, analysts have used these data to perform sensitivity analysis - finding out to what extent taxes and various types of noncash benefits each in their turn affect people's well-being.

Table 8 lists ten sets of poverty estimates. The first is the official poverty measure, which is based on money income (MI). Four others compare different, comprehensive, definitions of income (MI-Tx, MI-Tx+NC-MM, MI-Tx+NC, and MI$T x+N C+H E$, described in the text box on this page) with the official poverty thresholds, which are updated for inflation using the Consumer Price Index for Urban Consumers (CPI-U). In the remaining five sets of estimates, resources computed under these five income

[^16]definitions are compared with a lower set of poverty thresholds; these thresholds were computed using a different, experimental, method for updating for inflation (the CPI-U-X1), but are otherwise identical to the official thresholds.

The tax data were simulated in the alternative income definitions, based on a tax model. Four types of taxes were simulated: federal individual income taxes, state individual income taxes, property taxes on owner-occupied housing, and payroll taxes. Except for food stamps, the value of all the noncash benefits in the income definitions were imputed; those noncash benefits included values of employers' contributions for health insurance, medicare and medicaid, rent subsidies, free and reduced price school lunches, and return on equity in one's own home. ${ }^{24}$ Food stamp

[^17]Table 8.
Poverty Estimates Based on Alternative Measures of Income and Deflators: 2001 and 2002
(Numbers in thousands)

*Statistically different from zero at the 90-percent confidence level.
${ }^{1}$ Details may not sum to totals because of rounding.

Source: U.S. Census Bureau, Current Population Survey, 2002 and 2003 Annual Social and Economic Supplements.
amounts were used as reported in the CPS ASEC.

According to all ten sets of estimates, the number in poverty and poverty rate increased between 2001 and 2002. According to the CPI-U-based estimates, subtracting taxes and adding capital gains to the official income definition led to a poverty rate in 2002 lower by half of a percentage point, 11.6 percent, than the official definition. While it seems counterintuitive that using after-tax income would lead to a lower poverty rate, the $\mathrm{MI}-\mathrm{Tx}$ income measure also takes into
account capital gains (and losses), such as those earned on the sale of one's house, and the Earned Income Tax Credit, which benefits people with low income.

Including noncash benefits as income produced a greater effect on poverty rates than did taxes and capital gains. Excluding medicaid and medicare, noncash benefits led to a poverty rate of 9.9 percent in 2002 (MI-Tx+NC-MM). Including those medical programs further reduced the poverty rate by another half of a percentage point to 9.4 percent (MI-Tx+NC).

Imputed returns on home equity lowered the poverty rate by another 0.8 percentage points, to 8.6 percent in 2002 (MI-Tx+NC+HE).

Turning now to the CPI-U-XIadjusted thresholds, poverty rates for each set of estimates were lower than their counterparts based on the official thresholds since the adjusted thresholds are roughly 8 percent lower than official thresholds. With no adjustments to the money income definition, the poverty rate was 10.8 percent in 2002 using the CPI-U-XI-adjusted thresholds,

Figure 7.
Selected Alternative Poverty Estimates by Type of Deflator: 1959 to 2002

compared with 12.1 percent using the official thresholds. According to the most inclusive income definition (MI-Tx+NC+HE), the poverty rate was 7.5 percent in 2002 when based on the CPI-U-XI-adjusted thresholds, compared with 8.6 percent using the official thresholds. As was seen in the rates based on the official thresholds, treating noncash benefits as income lowered the poverty rate substantially when the thresholds were held constant.
Additional information about the NAS-based poverty estimates and the poverty estimates using alternative income definitions may be found on the Census Bureau's Poverty Web site, www.census.gov /hhes/www/poverty.html. The

Census Bureau plans to continue to issue reports on alternative estimates in order to help policymakers, researchers, and the public improve their understanding of how measurement issues affect their perception of who is in poverty.

## NOTES, ADDITIONAL DATA, AND USERS' COMMENTS

## CPS Data Collection

The information in this report was collected in the 50 states and the District of Columbia and does not include residents of Puerto Rico and outlying areas. The population controls used to prepare the estimates are based on results of Census 2000. Specifically, the estimates in this report are controlled to national population estimates by age, race, sex, and Hispanic or

Latino origin, and to state population estimates by age.

Because the CPS is primarily a household survey, people without conventional housing who are not living in shelters are excluded from these poverty statistics. The CPS also excludes armed forces personnel living on military bases and people living in institutions, such as jails. For further documentation about the CPS ASEC, see www.bls.census.gov/cps/ads /adsmain.htm.

## Model-Based State Estimates

The Census Bureau also produces improved (in the sense of having lower standard errors) annual poverty data for the states, as well as biennial estimates for counties,
based on models using data from the ASEC, the decennial census, and administrative records as well as personal income data published by the Bureau of Economic Analysis. Estimates for 1999 are available on the Internet at: www.census.gov /hhes/www/saipe.html. Estimates for income year 2000 will be available later this fall.

## Additional Data and Contacts

Detailed tables, historical tables, press releases and briefings, and unpublished data are available electronically on the U.S. Census Bureau's Poverty Web site. The Web site may be accessed through the Census Bureau's home page at
www.census.gov or directly at www.census.gov/hhes/www /poverty.html. Technical disclosure avoidance methods have been applied to CPS microdata to prevent disclosure of individuals' identities. These protected microdata are available for down-loading through the FERRET system. FERRET may be accessed by clicking on "Access Tools" on the Census Bureau's home page or by clicking the FERRET link on the poverty Web site.

If you have trouble finding poverty data or have questions about them, you may contact the Housing and Household Economic Statistics Division statistical
information staff by e-mail at hhes-info@census.gov or by telephone at 301-763-3242.

## Comments

The Census Bureau welcomes the comments and advice of data and report users. If you have suggestions or comments, please write to:

Charles Nelson
Assistant Division Chief, Income, Poverty, and Health Statistics
Housing and Household Economic Statistics Division
U.S. Census Bureau

Washington, DC 20233-8500
or send e-mail to
charles.t.nelson@census.gov.

## APPENDIX TABLES

Table A-1.
Poverty Status of People by Family Relationship, Race, and Hispanic Origin: 1959 to 2002
[Numbers in thousands. People as of March of the following year]

| Year and characteristic | All people |  |  | People in families |  |  |  |  |  | Unrelated individuals |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | Below poverty level |  | Total | All families |  | Families with female householder, no husband present |  |  | Total | Below poverty level |  |
|  |  |  |  | Below poverty level | Total | Below poverty level |  |  |  |  |
|  |  | Number | Percent |  |  | Number | Percent | Number | Percent |  | Number | Percent |
| ALL RACES |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 2002 | 285,317 | 34,570 | 12.1 | 236,921 | 24,534 | 10.4 | 40,529 | 11,657 | 28.8 | 47,156 | 9,618 | 20. |
| 2001 | 281,475 | 32,907 | 11.7 | 233,911 | 23,215 | 9.9 | 39,261 | 11,223 | 28.6 | 46,392 | 9,226 | 19.9 |

${ }^{\text {r }}$ For 1999, figures are based on 2000 census population controls. For 1992, figures are based on 1990 census population controls. For 1991, figures are revised to correct for nine omitted weights from the original March 1992 CPS file. For 1988 and 1987, figures are based on new processing procedures and are also revised to reflect corrections to the files after publication of the 1988 advance report, Money Income and'Poverty Status in the United States: 1988, P-60, No. 166.

NA Not available.
${ }^{1}$ Consistent with 2001 data through implementation of Census 2000-based population controls and a 28,000 household sample expansion.
${ }^{2}$ The 2003 CPS allowed respondents to choose more than one race. White alone refers to people who reported White and did not report any other race category. The use of this single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Information on people who reported more than one race, such as "White and American Indian and Alaska Native" or "Asian and Black or African American," in Census 2000 is forthcoming and will be available through American FactFinder in 2003. About 2.6 percent of people reported more than one race.
${ }^{3}$ For 2001 and earlier years, the CPS allowed respondents to report only one race group. The reference race groups for 2001 and earlier poverty data are: White, nonHispanic White, Black, and Asian and Pacific Islander.
${ }_{5}^{4}$ Black or African American alone refers to people who reported Black or African American and did not report any other race category.
${ }^{5}$ Asian alone refers to people who reported Asian and did not report any other race category.
${ }^{6} \mathrm{Hispanics}$ may be of any race.
Note: Prior to 1979, people in unrelated subfamilies were included in people in families. Beginning in 1979, people in unrelated subfamilies are included in all people but are excluded from people in families.

${ }^{\text {r }}$ 'For 1999, figures are based on 2000 census population controls. For 1992, figures are based on 1990 census population controls. For 1991, figures are revised to correct for nine omitted weights from the original March 1992 CPS file. For 1988 and 1987, figures are based on new processing procedures and are also revised to reflect corrections to the files after publication of the 1988 advance report, Money Income and Poverty Status in the United States: 1988, P-60, No. 166.

## NA Not available.

${ }^{1}$ Consistent with 2001 data through implementation of Census 2000-based population controls and a 28,000 household sample expansion.
${ }^{2}$ The 2003 CPS allowed respondents to choose more than one race. White alone refers to people who reported White and did not report any other race category. The use of this single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Information on people who reported more than one race, such as "White and American Indian and Alaska Native" or "Asian and Black or African American," in Census 2000 is forthcoming and will be available through American FactFinder in 2003. About 2.6 percent of people reported more than one race.
${ }^{3}$ For 2001 and earlier years, the CPS allowed respondents to report only one race group. The reference race groups for 2001 and earlier poverty data are: White, nonHispanic White, Black, and Asian and Pacific Islander.
${ }_{5}^{4}$ Black or African American alone refers to people who reported Black or African American and did not report any other race category.
${ }^{5}$ Asian alone refers to people who reported Asian and did not report any other race category.
${ }^{6}$ Hispanics may be of any race.
Note: Prior to 1979, people in unrelated subfamilies were included in people in families. Beginning in 1979, people in unrelated subfamilies are included in all people but are excluded from people in families.

## OFFICIAL BUSINESS

[^23]
[^0]:    ${ }^{1}$ The poverty rate for people aged 65 and over was statistically indistinguishable from the rate for 18 -to- 64 -year-olds. Because the poverty rates in this report are estimates, two groups that appear to have different poverty rates may not truly have different rates from one another. See text box.

[^1]:    ${ }^{2}$ The poverty rates for the various racial subgroups that include Asians (ranging from 10.0 to 10.3 percent) were not statistically distinguishable from one another.
    ${ }^{3}$ Because Hispanics may be of any race, data in this report for Hispanics overlap slightly with data for the Black population and for the Asian population. Based on the 2003 Current Population Survey Annual Social and Economic Supplement (CPS ASEC), 3.5 percent of Blacks who reported only one race and 1.6 percent of Asians who reported only one race were of Hispanic origin. For the poverty population, Hispanics made up 4.0 percent of Blacks (single race) and 1.6 percent of Asians (single race). Despite the sample expansion, single-year data for the American Indian and Alaska Native population and the Native Hawaiian and Other Pacific Islander population are not shown in this report because of their small sample sizes in the 2003 CPS ASEC. Data users should exercise caution when interpreting aggregate results for both the Hispanic population and the Asian population because they consist of many distinct groups that differ in socio-economic characteristics, culture, and recency of immigration. In addition, the CPS does not use separate population controls for weighting the Asian sample to national totals. For further information, see www.bls.census.gov/cps/ads /adsmain.htm.

[^2]:    -Represents zero. *Statistically different from zero at the 90-percent confidence level. For an explanation of confidence intervals, see "Standard errors and their use" at www.census.gov/hhes/poverty/poverty02/pov02src.pdf.
    ${ }^{1}$ Details may not sum to totals because of rounding.
    ${ }^{2}$ The 2003 Current Population Survey asked respondents to choose one or more races. White alone refers to people who reported White and did not report any other race category. The use of this single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census
    Bureau uses a variety of approaches. Information on people who reported more than one race, such as "White and American Indian and Alaska Native" or "Asian and Black or African American," is available from Census 2000 through American FactFinder. About 2.6 percent of people reported more than one race in 2000.
    ${ }^{3}$ Black alone refers to people who reported Black and did not report any other race category.
    ${ }^{4}$ Asian alone refers to people who reported Asian and did not report any other race category.
    ${ }^{5}$ Asian and/or Native Hawaiian and Other Pacific Islander refers to people who reported either or both of these categories, but did not report any other category.

    Source: U.S. Census Bureau, Current Population Survey, 2002 and 2003 Annual Social and Economic Supplements.

[^3]:    ${ }^{6}$ This supplement that collects income is now called the Annual Social and Economic Supplement (ASEC). It was formerly called the Annual Demographic Survey or simply the "March Supplement."

[^4]:    -Represents zero. *Statistically different from zero at the 90-percent confidence level. For explanation of confidence intervals, see "Standard errors and their use" at www.census.gov/hhes/poverty/poverty02/pov02src.pdf.
    ${ }^{1}$ Details may not sum to totals because of rounding.
    Source: U.S. Census Bureau, Current Population Survey, 2002 and 2003 Annual Social and Economic Supplements.

[^5]:    ${ }^{7}$ The poverty rate for people aged 65 and over was statistically indistinguishable from the rate for 18-to-64-year-olds.

[^6]:    ${ }^{8}$ Natives are defined as people born in the United States, Puerto Rico, or an outlying areas of the United States, and those born in a foreign country but who had at least one parent who was a U.S. citizen. All others are foreign-born regardless of date of entry into the United States or citizenship status. The Current Population Survey, the source of these data, does not extend to Puerto Rico or to the outlying areas of the United States, and thus those living there are excluded from the official poverty statistics.

[^7]:    ${ }^{9}$ These data refer to people aged 16 and older.

[^8]:    ${ }^{10}$ The poverty rates for the Northeast and Midwest were not statistically different from each other.

[^9]:    -Represents zero. *Statistically different from zero at the 90-percent confidence level.
    ${ }^{1}$ Details may not sum to totals because of rounding.
    Note: For explanation of confidence intervals, see "Standard errors and their use" at www.census.gov/hhes/poverty/poverty02/pov02src.pdf.
